

Chapter Five Managing Roles and Writing Styles (Personification)

5-1: Building a "Professional Persona" (Strict Critic, Kind Coach, or Anything You Want)

Many people think "role" means the same as "persona," whereas role is the **job title** (teacher, engineer), but persona is the **behavioral state and temperament** of that role.

You can design a "persona" with specific characteristics to direct the responses. Look at these 4 practical examples:

- **Critical Challenger:** Constantly finds faults, identifies blind spots, and challenges you. (Great for finding flaws in your plan.)
- **Empathetic Coach:** Constantly encourages, gently points out mistakes, and gives you morale. (Great for learning a language or sports.)
- **Impartial Journalist:** Reports only facts, without any emotion or judgment. (For analyzing news and data.)
- **Mad Scientist:** Gives out-of-the-box and even strange answers that no one else would think of. (For original ideation.)

How to write it in a prompt? Just put the personality traits next to the role:

*"As a **financial advisor** who is **very conservative, pessimistic about high risks, and fond of bitter jokes**, write me a savings plan..."*

With this one sentence, the responses will be full of risk warnings and a dry joke in between!

5-2: Imitating the Style of Famous Writers or Specific Brands (Style Writing)

AI has a wealth of texts from great writers and brands in its memory. You can use this treasure and tell the model **"write like so-and-so."** This completely changes the type of words, the kind of sentences, and even the rhythm of the text.

Let's give a few concrete examples, both Iranian and global:

- **Apple style:** Short, minimal, meaningful sentences focused on human experience. (Like: "Lighter. Thinner. More powerful.")
- **Nike style:** Motivational, imperative, combative, and challenging. (Like: "Do it now, not tomorrow.")

- **Sadegh Hedayat style:** Dark, depressed sentences, full of metaphors of emptiness and loneliness.
- **Kioumars Saberi's humor style (Gol-Agha):** Sweet colloquial words, sarcastic and biting.

How to write it:

*"Write an advertising text for my new headphones, but exactly **with the tone and sentence rhythm of the Apple brand** (seller of luxury and minimal products) and at the same time **write one line of it in the humor style of Kioumars Saberi** to make it a bit funny."*

AI will produce this strange combination for you too! Because it is familiar with both styles in its data.

5-3: Adjusting the Knowledge Level (From a 10-Year-Old Child to a University Professor)

This subcategory is the most important skill for a content producer. Many of us think "simple writing" means shortening words, whereas **simplification means using metaphors and tangible examples, and complication means using technical terms and analytical frameworks.**

Let's write a single concept like **"neural networks in AI"** at 3 levels so you can feel the difference:

- **10-year-old child level (tangible and playful):**

"Suppose you drop a group of your friends in the middle of a maze. Every time one of them hits a wall, you slap them in the face. They gradually learn which paths not to take so they don't get slapped. A neural network is exactly the same; a bunch of neurons that find the right path through punishment and reward."

- **Undergraduate student level (precise and technical but educational):**

"Neural networks consist of input, hidden, and output layers. Each layer contains a number of neurons connected by weights. During training, the loss function is calculated and with the backpropagation algorithm, the weights are updated to minimize the error."

- **PhD university professor level (challenging and frontier):**

"In deep architectures, the 'Vanishing Gradient' phenomenon in the initial layers is one of the main obstacles. Novel architectures like Residual Networks and Attention Mechanism try to solve this problem by passing through direct layers (Skip

Connections) or dynamic weighting. The current debate is about explainability (XAI) and the interpretability crisis of these models with hundreds of billions of parameters."

★ A Combined Prompt from All 3 Techniques of Chapter Five (A Masterpiece of Personification)

See what happens when you mix all 3 together:

"I want to write a story for elementary school children about the importance of saving water.

[Persona] *Narrate this story from the tongue of a jovial and slightly humorous old man who has lived in the desert.*

[Style imitation] *Write exactly in the style of Sadegh Karmiyyar (a simple and child-friendly writer) whose sentences are short and sweet.*

[Knowledge level] *Write it in such a way that an 8-year-old child gets the main message without needing any extra explanation and is excited to act on it."*

Practical Assignment for Chapter Five (So I Can See You've Become a Master of Personification):

Suppose you are going to write an **official report about the water crisis** for the president of a country, and at the same time write an **emotional and pleading post** about the same topic for environmental activists on social media.

Assignment: Write only one prompt in which you ask AI to produce **both of these texts** together, but specify that the tone, persona, and knowledge level of each must be completely different. (Hint: Use the conditional technique from Chapter Four or clear separation.)
