

Chapter Seven Conversation Engineering (Multiple Rounds of Back-and-Forth)

7-1: Sequential Prompts (Continuous Q&A)

What's the story?

Many beginners think that to get an excellent result, they need to write a 1000-word prompt and say everything at once. But this both exhausts the AI (because it mixes up details) and exhausts you.

The solution is to **advance the work step by step**. That is, instead of ordering a 10-story building, first draw the structural plan, then the plumbing, then the facade.

How to execute (the stepwise technique):

- **Step 1 (Outline):** "Write an outline for a 1000-word article about the impact of AI on accounting jobs."
- **Step 2 (Filling in details):** "Now write the introduction section completely from the outline you gave."
- **Step 3 (Refining and completing):** "Write the second section (challenges) as well, but this time with 3 real examples of existing accounting software."
- **Step 4 (Finalizing):** "Now write a concluding summary for the whole article and at the end pose 3 questions for discussion."

Golden tip: At each step, be sure to refer to the previous prompt! For example, say: "Based on the introduction you wrote in the previous step, now move on to the next section..." This maintains complete consistency between sections.

7-2: The "Ask the Model" Technique (Ask the Model Itself What Information It Needs to Complete This Task)

This technique is **the most powerful way to eliminate ambiguity**. Many times we ourselves don't know exactly what information we need to do a task. Instead of guessing and drowning the prompt in details, **you throw the responsibility onto the AI itself!**

The magic command is:

*"I want to do [final goal]. You, as an expert, **ask me the questions you need to complete this task** so that once I answer them, you deliver the best possible output."*

Practical example:

Suppose you want to design a **bodybuilding workout plan**, but you don't know what parameters are important.

- **Your prompt:** *"I want to design a 4-week workout plan for muscle growth. You, as a professional coach, ask me any questions you need to write this plan (such as age, weight, injury history, number of training days, available equipment). Until I answer all your questions, do not write the plan."*

The AI starts asking intelligent questions. You answer, and ultimately, with all the information, the model delivers a 100% personalized plan that you would never have achieved with a one-shot order.

7-3: Managing the Context Window — How to Summarize Long Conversations So the AI Doesn't Get Confused

What's the story?

AI has a "temporary memory" called the **Context Window** (like a computer's RAM). For example, the free version of ChatGPT remembers about 128 thousand tokens (about 90-100 book pages), but older versions less.

The problem is that when the conversation gets long and exceeds this limit, the AI **forgets the first parts of the conversation** and gradually falls into "hallucination" or "irrelevance."

3 golden solutions to manage this problem:

1. Periodic Summarization:

Every 10 to 15 exchanges, send a prompt saying: *"Summarize all our conversations so far in 3 very condensed paragraphs. Keep the key decisions and important results."* Then start the new conversation with that summary: *"Based on the summary you gave, now I want to start the next stage..."*

2. Key-info pinning:

In each new prompt, repeat the most important information again. For example: *"My goal is still to lose 5 kg in one month (as I said at the beginning). Now, considering this goal, give me today's plan."* This saves the model from having to go back 20 messages to recall the goal.

3. The Reset Trick (Starting a New Conversation with a Summary):

When the work gets very long and you feel the model is getting confused, open a new chat and send exactly this: *"In the previous chat, I was talking with you about [topic]. We reached these conclusions: [list of 5 key conclusions]. Now I want to continue from here: [new request]. Please continue."*

Combined Practical Project for Chapter Seven (Orchestra Leadership Exercise)

Now let's implement all 3 techniques in a real scenario. Suppose you want to write a **"6-Month Content Strategy Guide"** for your company.

Your sequential prompt would be like this:

Stage 1 (Ask the model):

"I am the marketing manager of an online home appliance store. I want to write a 6-month content strategy. As a content strategist, ask me any questions you need to write this strategy (such as budget, target audience, competitors, platforms). Until I answer all of them, don't write anything."

(The model asks its questions and you answer)

Stage 2 (Step one - skeleton):

"Based on the answers you gave to your questions, now write an outline of this 6-month strategy that includes 6 monthly phases."

Stage 3 (Step two - details):

"Very good. Now complete phase one (month one) and for each week give a suggested topic for content production."

Stage 4 (Context management - before step three):

(Because the conversation has gotten long, before the next stage you send this):

"Write a very condensed summary of what we have said so far about the home appliance store and the first phase of the strategy, so I can make sure everything is in your mind."

Stage 5 (Continue with summary):

"Based on the summary you wrote, now move on to phase two (month two) and design an editorial calendar for it."

 Practical Assignment for Chapter Seven (To Finalize Your Conversation Skill):

Suppose you want to write a **10-page short novel**, but you have no idea. Write a 3-stage scenario in which:

1. First, ask the model to ask its questions about genre, characters, and story atmosphere (technique 7-2).
2. Then ask it to write the outline of the story in 5 parts (technique 7-1).
3. Finally, write a prompt for "conversation summarization" so that if you want to continue tomorrow, you can start with that summary (technique 7-3).
